

The Parker YP20 Probe Light is a molded inspection light designed to fit the P2 Contour Probe (Yoke). The light produces substantial close-in illumination for magnetic testing. The Parker YP20 light operates from the induction of the AC magnetic field produced by the Yoke. A small coil wound within the molded light housing produces around 12 volts AC which operates the small cylindrical shaped bulb. There are no wiring connections necessary for installation.

The YP20 Probe Light is designed to fit the rear leg housing of the Parker P2 Contour Probe. The light is molded from durable glass filled nylon which is extremely resistant to shock, wear and chemicals. The bulbs are an automotive dome light bulb which may be available from local sources. Replacements are also available from Parker at minimal cost.
